

SmartTrust Grows Certification Program to Address S@T Testing

Expansion Builds on Success of Company's Wib Certification Efforts

STOCKHOLM, March 10, 2009 – SmartTrust, a developer of MDM and SIM management software for mobile operators, today announced the expansion of its certification program to support the testing of S@T-based SIM (Subscriber Identity Module) cards. This latest effort complements SmartTrust's existing program which has helped smart card vendors and operators certify more than 110 different implementations of SmartTrust Wib™-based SIM cards.

Through the most complete SIM certification program available, companies can now ensure the successful implementation of virtually any SIM. This combined approach helps to streamline processes and ultimately allow the value of the SIM to be realized.

"With our ability to test and certify S@T cards, SmartTrust brings a neutral and objective view which helps ensure the cards are operating to their full potential," said Fredrik Almgren, director of product management for SmartàLaCarte, SmartTrust. "We believe this effort will help to increase the availability of compatible SIM cards and benefit the entire wireless industry through more uniform technology."

The SmartTrust certification program continues to provide the operators of wireless networks with peace of mind. For instance, SIM cards certified through the program minimizes interoperability issues that will delay projects and increase cost.

The expanded certification program comes just months after SmartTrust introduced its Universal Gateway solution. This single gateway is capable of supporting any Dynamic SIM Toolkit (DSTK) enabled SIM card based on the Wib or S@T specifications. The Universal Gateway gives mobile operators full flexibility and freedom to run a dual technology environment optimizing their investment in SIM cards and associated technology for every individual subscriber or end-user.

Operators can now easily switch to the Wib based SIM cards without losing the investment in the S@T based SIM cards and obtain maximum flexibility in the most cost effective manner for future SIM card procurements.
